Budget VS Actual :

New Power BI file me “Financial_data.xlsx” open krna, Calendar, COA, GL, Territory k tables import krny then “Budget.xlsx” ka data open krna and Budget table import krna. Connection bnany and Aggregation None krni Year ki.

→ Tbl_GL me Actual results ha aur Budgeted results tbl_Budget table me. This means Total_FTP represents only the actual results. Hmy Budgeted FTP calculate krni:

Total_FTP_Budget = SUM(tbl_Budget[Amount])

→ Drag the FTP and **Total_FTP_Budget into a matrix and apply the filter of Sales.**

→ **Date-wise dekhny kaliye Date ko rows m e drag krna and breakdown b kr skty.**

→ Budget ko pehle rakhe aur FTP ko baad mein, aise in dono values mein difference samajh nahi aata ke budget zyada raha ya kaam raha. Tou new measure bnani.

Vaiance_FTP = [Total_FTP] - [Total_FTP_Budget]

Jha sales zada aur Budget kamm wha positive value aye gi.

→ Variance ko drag krna, but still reag krna prh rha k knsi negative value means k Jha Budget zada aur sales kamm aur knsi Positive. Tou iskaliye hm Conditional Formatting ki traf move kry gy. A beautiful method to represent value inside tables. Visual select kr k Values se Variance_FTP k dropdown se Conditional Formatting select krni.

→ BG Color, Data bars, Icon, … Select kr skty ha.

→ Which field should we base this on? Me Variance_FTP hi select rkhni. Koi aur b kr skty ha but in this case, Variance.

→ BG color select krna, Lkn hm dekh skty k kuch negative value ko red hna chihy lkn ye Middle color me dekha rha. So hm yha “RULE” ka option use krna. BG color me 3 options hty-> Gradient, Rule, and Find Values.

→ RULES me hm define kry gy k Value >= 0 and < 10000000000 , Value >= - 1000000000 and < 0

→ Next option is to use Databars, easy to use.

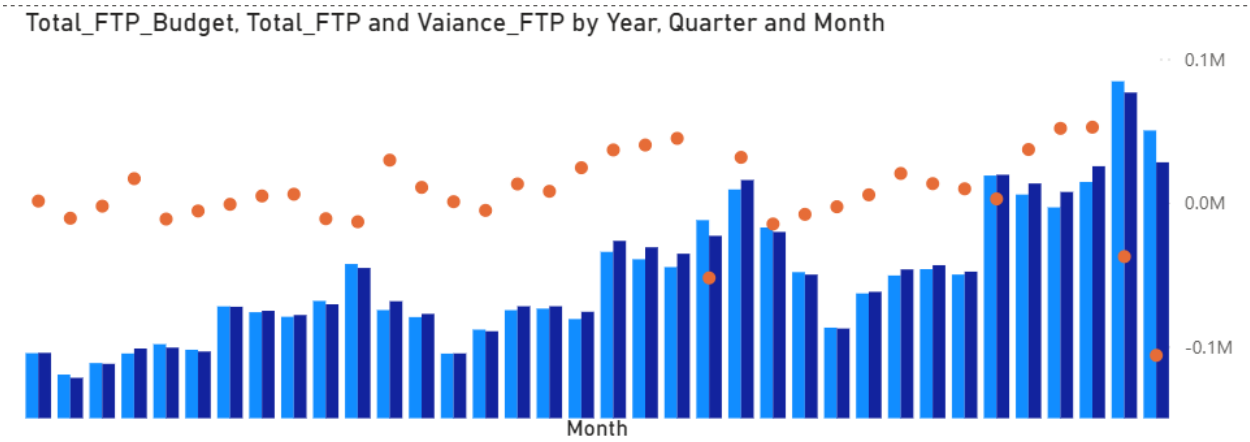
→ **Another way to use conditional formatting:**

Variance_FTP ko delete krna matrix se aur TOTAL_FTP k drop down se ja k Conditional formatting se BG Color base on Variance_FTP krna. Hm TOTAL_FTP_Budget ko b delete krty, ftp pr formatting show kr rhi k kaha sales zada and kaha Budget.

→ Visualization:

Remove Conditional Formatting, Drag back FTP_Budget, and Variance. Copy-paste this matrix.

→ New matrix pr hm visual bnaye gy. Clustered column chart. Ye Actual aur Budget k columns bnaye ga lkn Variance in form of column not looks good. So hm isy line me drag kr k marker add kr k line ko disappear kr dena.



→ Show Variance as Percentage:
Hmari Sales itny percent Budget se increase hoi ya itny percent decrease hoi.
Variance_FTP_Percentage = [Vaiance_FTP] / [Total_FTP_Budget] -> %
Drag in visual and remove Value of Variance.

→ Aik measure bnani jis me hm sirf outlier ko define kry gy k hm outliers show kro. Ye hm company se pouchy gy k kitni ranges me values ko as outlier define krna.
→ In this case above 5% in both negative as positive defined as outlier.
Variance_FTP_Outliers = IF([Variance_FTP_Percentage] > .05 || [Variance_FTP_Percentage]< -.05, [Variance_FTP_Percentage], "")

Drag this in the matrix and visual aur visual se previous ko remove kro. Ye hmy ab sirf outliers dekha rha.

→ What about the cost of sales? I mean, what about the expenses?
So let us look at one of the values. You can see that our actual results are actually higher. My budget is 2.4 million and 55,000. And actual results are 24,094,000. And the answer is negative. So now we can confidently say that wherever we see the negative values, our answers are worse off.

P&L Statement			
Year	2018		
Class	Total_FTP	Total_FTP_Budget	Vaiance_FTP
Trading account			
Sales	3,575,428	3,573,886	1,542
Cost of Sales	-1,192,182	-1,213,053	20,871
Operating account

Designed P&L. Hm sirf Variance Ftp ki value rkh k b skto 3no years ka aik sath me delh skty ha.

Calculation of budgeted values for the balance sheet:

Create matrix, Drag date, and Total_TDD. Hm aik specific account dekhny kaliye Assets ka filter lga dein gy. Imp point: Ye Total_TTD actual values kaliye ha.Hmy Budgeted kaliye separate calculate krni hni.

Total_TTD_Budget = CALCULATE(SUM(tbl_Budget[Amount]), FILTER(tbl_Calendar, tbl_Calendar[Date] = MAX(tbl_Budget[Date])))
→ Calculate the sum of amount from the budget column. But filter down the data and only consider the values to be summed up where the table calendar date is equal to the maximum date in this data.
Variance_TTD = [Total_TTD] - [Total_TTD_Budget]

→ For the assets, we expect that when the assets are lower than the budget, it means that we have invested less money into the assets. It should be treated as a positive value.

→ It is something that we need to remember that I can either fix it for assets or for liabilities. So if my logic is properly set up here, that the actual results are less in case of budget, this will be opposite in case of liabilities. So we will have to be careful when interpreting results.
→ Measure me changes kry gy, and deduct the actual value from the budget.

→ Percentage Variance:

Variance_TTD_Percentage = [Variance_TTD] / [Total_TTD_Budget]

→ Outlier Detection:

For TTD, the threshold value is 3%. Wo values jo 3% exceed kry positive aur negative me sirf unhy show krna,

Variance_TTD_Outliers = IF([Variance_TTD_Percentage] > .03 || [Variance_TTD_Percentage] < -.03, [Variance_TTD_Percentage], "")
